The library was characterised by oligonucleotide fingerprinting
(ONFP) to reduce sequencing redundancy. According to the ONFP
procedure, clones giving the same hybridisation pattern with a
battery of 200 8mer oligonucleotides are grouped into clusters. One
clone per cluster is selected for sequencing. The size of each
cluster is an indicator of the frequency of a transcript in the
analysed library. The cluster size as well the coordinates of the
rest of the clones assigned to the same fingerprint cluster as the
clone from which the above EST is generated is available at the
amphicous project site at: http://www.molgen.mpg.de/amphicous/

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Email: poustka@molgen.mpg.de
The library was characterised by oligonucleotide fingerprinting
(ONF) to reduce sequencing redundancy. According to the ONF
procedure, clones that display the same hybridisation matrix with a
battery of 200 8mer oligonucleotides are grouped into clusters. One
clone per ONF cluster is selected for sequencing. The size of each
cluster is an indicator of the frequency of a transcript in the
analysed library. The cluster size as well as the coordinates of
the other clones assigned to the same ONF cluster as the clone from
which the above EST is generated is available at the sea urchin
project web site at: http://www.molgen.mpg.de/ag_seaurchin/.cDNa
clones and filters are distributed via the Resource Center/Primary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Max-Planck-Institut fuer Molekulare Innestr.63-73, D-14195 Berlin, Germa Tel: +49 30 8413 1235

The library was characterised by oligonucleotide fingerprinting
(ONF) to reduce sequencing redundancy. According to the ONF
procedure, clones that display the same hybridisation matrix with a
battery of 200 Bmer oligonucleotides are grouped into clusters. One
clone per ONF cluster is selected for sequencing. The size of each
cluster is an indicator of the frequency of a transcript in the
analysed library. The cluster size as well as the coordinates of
the other clones assigned to the same ONF cluster as the clone from
which the above EST is generated is available at the sea urchin
project web site at: http://www.molgen.mpg.de/ag_seaurchin/.cDNA
clones and filters are distributed via the Resource Center/Primary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CD295681 442 bp mRNA linear ES StrPu691.007076 Sea urchin larva cDNA library MPMGp691

One clone per ONF cluster is selected for sequencing. The size of each cluster is an indicator of the frequency of a transcript in the analysed library. The cluster size as well as the coordinates of the other clones assigned to the same ONF cluster as the clone from which the above EST is generated is available at the sea urchin project web site at: http://www.molgen.mpg.de/ag_seaurchin/.cDNA clones and filters are distributed via the Resource Center/Primary Database of the German Human Genome Project (http://www.rzpd.de) PCR PRIMEERS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         integration of 20,000 unique sea urchin EST clusters genome Res. 13 (12), 2736-2746 (2003)

The library was characterised by oligonucleotide fingerprinting

(ONFP) to reduce sequencing redundancy. According to the ONFP

procedure clones giving the same hybridisation pattern with a

battery of 200 8mer oligonucleotides are grouped into clusters. One

clone per cluster is selected for sequencing. The size of each

cluster is an indicator of the frequency of a transcript in the

analysed library. The cluster size as well as the coordinates of

all clones assigned to the same fingerprint cluster as the clone

from which the above EST is generated is available at the amphioxus

project site at http://www.molgen.mpg.de/amphioxus.

Clones and filters are distributed via the Resource Center/Primary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               481

Panopoulou,G., Hennig,S., Groth,D., Krause,A., Poustka,A.J., Herwig,R., Vingron,M. and Lehrach,H.

New evidence for genome-wide duplications at the origin of vertbbrates using an amphioxus gene set and completed animal BFL26 002560 Amphioxus 26hr cDNA library (Name convention: BFL26 or MPMGp531) Branchiostoma floridae cDNA clone MPMGp531L07115 5', mRNA Branchiostoma floridae BI387857.1 GI:30922696 Eukaryota; Metazoa; Chordata; Cephalochordata; Branchiostomidae; Branchiostoma floridae (Florida lancelet) (bases 1 to 553) 553 bp mRNA linear EST 26-AUG-2003

Email: panopoul@molgen.mpg.de
The library was characterised by oligonucleotide fingerprinting
(ONFP) to reduce sequencing redundancy. According to the ONFP
procedure, clones giving the same hybridisation pattern with a
battery of 200 Bmer oligonucleotides are grouped into clusters. One
clone per cluster is selected for sequencing. The size of each
cluster is an indicator of the frequency of a transcript in the
analysed library. The cluster size as well the coordinates of the
rest of the clones assigned to the same fingerprint cluster as the
clone from which the above EST is generated is available at the
amphioxus project site at: http://www.molgen.mpg.de/amphioxus/
clones and filters are distributed via the Resource Center/Primary Database of the German Genome Project (http://www.rzpd.de) FORWARD: 5' CCCCAGGCTTTACACTTTATGCTTCCGGCTCG 3' BACKWARD: 5' GCTATTACGCCAGCTGGCGAAAGGGGGATGTG 3' (MI3RSP)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       source
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo. NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's Pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

Gene coding for creatinine amidinohydrolase - used to quantify blood or urinary creatinine as a disease indicator.

Claim 4; Page 10-11; 12pp; Japanese.

which has a low Km value for creatine. The creatinine amidinohydrolase has the following physicochemical properties: (a) action: converts creatine and water into sarcosine and urea; (b) optimum tempo: 40-45 deg.C; (c) optimum pH: 8.0-9.0; (d) thermal stability: about 50 or less (pH 7.5, 30 mins); (e) stable pH: a Ph range of about 4-10; (f) Km value: about 15.2 mM; (g) mol. wt: about 4300 (SDS-PAGE); and (h) isoelectric point: about 3.5. The creatinine amidinohydrolase may be used in the quantification of blood or urinary creatinine and creatine as an This sequence encodes a thermally stable creatinine amidinohydrolase indicator of various diseases

A novel creatine amidinohydrolase enzyme has been developed which catalyses the reaction of creatine with water to form sarcosine and urea, is stable at temperatures of up to 50 degrees Celsius (pH 7.5, 30 minutes) and has an optimum temperature of 40-50 degrees (pH 7.5, 30 pt mum pH of 8-9, a Km value for creatine of 3.5-10 mM in a binding assay using sarcosine oxidase and peroxidase, a molecular weight of 43 kD by SDS-PAGE and an isoelectric point of 3.5. The present sequence encodes creatine amidinohydrolase derived from Alcaligenes faecalis strain TE3581 (FERM p-14237) which is the wild type creatine amidinohydrolase to be mutated in the present invention. The enzyme can be used to determine creatine in a sample by measuring the absorbance of a dye formed by reacting the sample with a reagent, comprising the enzyme, sarcosine oxidase and a composition for detecting hydrogen peroxide, e.g. for diagnosis of

                                         This DNA encodes a stable creatine amidinohydrase which is a mutant creatine amidinohydrase and has improved long-term stability in a ne buffer compared to wild type creatine amidinohydrase. A recombinant plasmid containing the stable creatine amidinohydrase gene can be us transform a cell for the recombinant production of the enzyme. This stable creatine amidinohydrase is useful as a diagnostic agent can be produced commercially
                                                                                                                                                                                                                                      Disclosure;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1140
```

The invention relates to Alcaligenes faecalis creatine amidinohydrolase, which catalyses creatine and water to sarcosine and urea. Creatine amidinohydrolase can be produced by culturing a microorganism producing the protein in a nutrient medium and recovering the protein from the resulting culture. Creatine amidinohydrolase is useful as a routine reagent for clinical tests for determining creatine and creatinine in biological samples. This is particularly useful in diagnosing diseases such as uraemia, chronic nephritis, acute nephritis, giantism and tonic muscular dystrophy. The presence of creatine in a sample can be determined by measuring an absorbance of a pigment produced by the reaction of a reagent containing creatine amidinohydrolase with the sample. This sequence represents genomic DNA encoding Alcaligenes Disclosure; Page 15-16; 21pp; English

                                                                                                                                                 The present invention describes a stable mutant creatine amidinohydrase having a long-term stability in a neutral buffer solution. Also described are: (1) a creatine amidinohydrase gene encoding the above stable creatine amidinohydrase; (2) a gene encoding a mutant creatine amidinohydrase; (2) a gene encoding a mutant creatine compared to wild type creatine amidinohydrase, in which at least one gene among those found in a fully defined 1212 nucleotide sequence (the present sequence) is replaced by another gene; (3) a recombinant plasmid containing a gene encoding the above creatine amidinohydrase; (4) a cell transformed by the above plasmid; and (5) a method for the preparation of a stable creatine amidinohydrase in which the above cell is cultured in a medium and creatine amidinohydrase is collected. The creatine amidinohydrase is useful as a clinical diagnosing agent
                                                                                                           Sequence 1212
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mutant creatine amidinohydrase for use in cl
term stability in a neutral buffer solution.

CAH DNA can be inserted into host cells for the prodn. of CAH. CAH can now be produced efficiently without having to add creatine to the culture medium. New variant of an Erwinia-type creatinase modified relative to a wild-type creatinase having creatinase activity, useful for determining creatinine and/or creatine concentration in a sample.

Disclosure; Page 15-17; 51pp; English

The present invention describes a variant of an Erwinia-type creatinase (I) modified relative to a wild-type creatinase having creatinase activity. The variant comprises at least one amino acid substitution at a position of the fully defined 404 amino acid sequence given in ABR43467: these are selected from N130, M203, IZ78, I1304 and F395. Creatinase has the EC number EC 3.5.3.3 and is also known as creatine amidinohydrolase. Also described is a reagent (II) for determining creatine comprising the Erwinia-type creatinase variant. The variant is useful for determining creatinine and/or creatine concentration in a sample. Measuring creatinine and creatine are useful for diagnosing uraemia, chronic creatinine and creatine are useful for diagnosing uraemia, chronic nephritis, acute nephritis, gigantism, tonic muscular dystrophy and some other related diseases. The mutant enzymes have improved stability, lower conductivity and/or lower Km-values for creatine: they are much better suited to detection methods for creatine. The present sequence encodes Erwinia sp. (DSM 97-934) wild-type creatinase from the present invention 1215 BP; 242 A; 392 C; 358 ဂ္ 223 T; 0 U; 0 Other; lower

New variant of an Erwinia-type creatinase modified relative to a w type creatinase having creatinase activity, useful for determining creatinine and/or creatine concentration in a sample.

4; Page 33-35; 51pp; English.

The present invention describes a variant of an Erwinia-type creatinase (I) modified relative to a wild-type creatinase having creatinase activity. The variant comprises at least one amino acid substitution at a position of the fully defined 404 amino acid sequence given in AER43467: these are selected from N130, M203, I278, I1304 and F395. Creatinase has the EC number EC 3.5.3.3 and is also known as creatine amidinohydrolase. Also described is a reagent (II) for determining creatine amidinohydrolase. Erwinia-type creatinase variant. The variant is useful for determining creatinine and/or creatine are useful for dagnosing uraemia, chronic creatinine and creatine are useful for dagnosing uraemia, chronic creatinine, acute nephritis, gigantism, tonic muscular dystrophy and some other related diseases. The mutant enzymes have improved stability, lower conductivity and/or lower Km-values for creatine: they are much better suited to detection methods for creatine. The present sequence encodes a Erwinia creatinase from the present amidinohydrolase. ine comprising the lower

New variant of an Erwinia-type creatinase modified relative to a w-type creatinase having creatinase activity, useful for determining creatinine and/or creatine concentration in a sample.

Example 4; Page 20-21; 51pp; English.

The present invention describes a variant of an Erwinia-type creatinase (C) I) modified relative to a wild-type creatinase having creatinase (C) activity. The variant comprises at least one amino acid substitution at a CC position of the fully defined 404 amino acid sequence given in ABR43467: these are selected from N130, M203, I278, I1304 and F395. Creatinase has CC the EC number EC 3.5.3.3 and is also known as creatine comprising the EC Also described is a reagant (II) for determining creatine comprising the CC Erwinia-type creatinase variant. The variant is useful for determining CC creatinine and/or creatine concentration in a sample. Measuring CC creatinine and creatine are useful for diagnosing uraemia, chronic CC nephritis, acute nephritis, gigantism, tonic muscular dystrophy and some CC conductivity and/or lower Mr-values for creatine: they are much better conductivity and/or lower Mr-values for creatine. The present sequence encodes a cutant Erwinia creatinase from the present invention
